

D40ML Series

Magnetic latching combines with RFID technology to deliver high holding force and tamper resistance

- RFID provides a high degree of tamper resistance.
- Clean/Sanitize in Place – stainless steel versions are rated IP69K
- LEDs support easy fault diagnosis
- Install up to 20 switches in series
- Residual magnetism acts as light door latch after unlocking
- Two actuator types with type 4 coding
 - Basic – all actuators in the system are identically coded.
 - Unique – every actuator is individually coded. 32,000,000 codes
 - Both offer tolerance for misalignment
- Two switch sizes provide multiple holding force options
 - Medium Duty
 - Stainless Steel: $F_{1\max}$ (typical) 600 N, F_{zh} 450 N
 - Plastic and Diecast: $F_{1\max}$ (typical) 900 N, F_{zh} 675 N
 - Heavy Duty
 - Stainless Steel: $F_{1\max}$ (typical) 950 N, F_{zh} 700 N
 - Plastic and Diecast: $F_{1\max}$ (typical) 1500 N, F_{zh} 1150 N
- Three case materials
Plastic, diecast metal, 316 stainless steel
- For use on machines with no rundown time if power is lost

Information with regard to UL508		Use LVLC or Class 2 supply. Type 1 enclosure.
Risk Time in accordance with EN 60947-5-3		150 ms (switching off delay at removal of actuator)

*1 A new test has been introduced with the coefficient 1.3. A device with a specified maximum holding force (F_{zh}) of 500 N needs to hold up a force test (F_{1max}) at 650 N.

According to the standard the locking force F_{zh} should be stated for every guard locking switch.

Note: When the product use deviates from these assumptions (different load, operating frequency, etc.) the values must be adjusted accordingly.

Installation:

- Installation of all D40ML series safety switches must be in accordance with a risk assessment for the individual application.
- The use of a safety relay is required for monitoring RFID coded switches. These relays monitor two redundant circuits as per ISO13849-1 for up to PLe/Category 4 protection.
- D40ML series switches are designed to operate with most dual channel safety relays to satisfy EN60947-5-3.
- M5 mounting bolts must be used to mount the switches. Tightening torque for mounting bolts to ensure reliable fixing is 1.0 Nm. Always mount on non-ferrous materials.
- Do not mount adjacent switches or actuators closer than 30 mm.
- To achieve nominal holding force ensure face-to-face alignment of magnetic parts.
- After installation always check each switch function by opening and closing each guard individually in turn and ensuring that the Green LED on the switch and the LEDs on the safety relay are illuminated when the switch is closed and are extinguished when the switch is open. Check that the machine stops and cannot be re-started when each switch is open.

Maintenance/Safety Checks: Monthly: Check alignment of actuator and look for signs of mechanical damage to the switch casing or cables. The safety functions and mechanics must be tested regularly. For applications where infrequent guard access is foreseeable, the system must have a manual function test to detect a possible accumulation of faults. At least once per month for PLe Cat3/4 or once per year for PLd Cat3 (ISO13849-1). Where possible it is recommended that the control system of the machine demands and monitors these tests, and stops or prevents the machine from starting if the test is not done. (ISO14119). Check that the machine stops and cannot be re-started when each switch is open.

NOTE: The safety outputs will only close when the actuator is in place and the lock magnet is energized. Forcing open of the lock will cause the safety outputs to open.

IMPORTANT: The guard holding has no interlock function. The Risk Assessment for the particular application should include the risk of spare actuators. Spare actuators should not be readily available and must be securely controlled. Record any RFID codes as required by factory rules or with reference to any risk assessment for the particular application and user location.
